

GripLock Finger™

Naked Prosthetics' solution for partial-hand limb difference proximal to the MCP.

The **GripLock Finger** is designed for digits two through five and is a passive positionable digit prosthesis. It is intended for use in conjunction with a custom fabricated socket which is fit by a certified prosthetist.

Users can position the finger into varying degrees of flexion by using their opposing hand or a hard surface. The **Griplock** Finger can then release to full extension by depressing the dorsal pawl (lever) or flexing past last locking position.

Adding a **GripLock** Finger can restore length, encourage bilateral hand use, prevent metacarpal deviation and be a valuable tool for participation in activities of daily living.

This device can be worn in combination with our **MCPDriver™**, **PIPDiver™**, and/or **ThumbDriver™**, and is offered in the same colors and design choices our users love.

- Field serviceable fairings
- Silicone fingertip pad
- Machined aluminum
- Case-hardened stainless steel

This design is optimized for high load carrying capacity.

The **GripLock** Finger weighs in at an industry best of 25 grams and a break strength of over 200lb.
